Learning Outcomes

The module imparts the fundamentals of space technology. It is important for students to have a general knowledge in several space related technical and programmatic subjects in space technology, but also in the utilization of space. Goal of the module is to produce skills in design of spacecraft subsystems, selection of system solutions for different areas in astronautics and identification of critical elements of a space mission. Another goal is for the students to gain competence in handling problems in any space related subject, being able to make trade-offs under use of small numerical programs, being able to think systematically in a professional environment and being able to evaluate space system solutions.

Content

- Engineering tools (e.g. MATLAB, CAD software)
- Scientific documentation with Latex
- History of spaceflight
- Space utilization
- Space environment
- Orbital mechanics
- Rocketry
- Space propulsion
- Launch vehicle
- Re-entry
- Space stations
- Space debris
- Earth satellites

Workload and Credit Points

The Workload of the module sums up to 270.0 Hours. Therefore the module contains 9 Credits.

Description of Teaching and Learning Methods

The module consists of a theoretical lecture, exercises and homework.

Requirements for participation and examination

Desirable prerequisites for participation in the courses:
None.

Mandatory requirements for the module test application:
No information
Module completion

Grading: graded  
Type of exam: Portfolio examination  
Language: English  
100 points in total

Grading scale:
Note: 1.0 1.3 1.7 2.0 2.3 2.7 3.0 3.3 3.7 4.0  
Punkte: 95.0 90.0 85.0 80.0 75.0 70.0 65.0 60.0 55.0 50.0

Test description:
Throughout both semesters, assignments and quizzes on the theoretical content are given. Every student gives a short presentation about a selected topic in space engineering and his/her oral feedback on selected topics in space engineering is graded. The course is concluded with a final test about the whole content of the lecture course.

Duration of the Module

This module can be completed in 2 semesters.

Maximum Number of Participants

This module is not limited to a number of students.

Registration Procedures

Registration at the MSE secretary according to the MSE study and examination regulations. Dates and deadlines will be announced by semester start.

Recommended reading, Lecture notes

Lecture notes: available  
Electronical lecture notes: available

Additional information:
The script will be handed out for free in the first lecture.

Recommended literature:
Handbuch der Raumfahrttechnik, Hallmann, W. und Ley, W., München, Wien, Hanser 1999, 792 S

Assigned Degree Programs

This module is used in the following modulelists:

Space Engineering (Master of Science)
StuPO 2014
Modullisten der Semester: SS 2020

Miscellaneous

No information
Learning Outcomes

During and after their studies, MSE students are most likely to collect work experience in the German aerospace sector. The module German for Engineers is designed to help students to work in the engineering environment. The module A1.1 corresponds to basic users of the language, who communicate in everyday situations with commonly-used expressions and elementary vocabulary. After completing the A1.1 module, students can understand and use very frequently-used everyday expressions as well as simple phrases to meet immediate needs. They can introduce themselves and others, ask and answer questions about personal details and interact in a simple way provided the other person talks slowly and clearly.

Content

- Introductions
- Talking about personal details such as where students live, things they have and people they know.
- Counting
- Hobbies
- Ordering food, talking about food
- Expressing not having and needing things
- Talking about things
- Talking about what one can and cannot do
- Expressing prices
- Telling time
- Naming days of the week and months

Miscellaneous
Prerequisite for a successful completion is the regular participation in the course (at least 80%).
During and after their studies, MSE students are most likely to collect work experience in the German aerospace sector. The module German for Engineers is designed to help students to work in the engineering environment. The module A1.2 corresponds to basic users of the language, i.e. those able to communicate in everyday situations with commonly-used expressions and elementary vocabulary. After completing the A1.2 module, students can understand and use very frequently-used everyday expressions as well as simple phrases to meet immediate needs. They can introduce themselves and others, ask and answer questions about personal details and interact in a simple way provided the other person talks slowly and clearly.

Content
- Talking about daily routine, work activities
- Making appointments
- Making directions
- Describing locations
- Talking about time and duration
- Talking about taste and preferences
- Naming body parts
- Naming items of clothing
- Talking about past using Perfekt
- Expressing likes and dislikes
- Modal verbs

Learning Outcomes

During and after their studies, MSE students are most likely to collect work experience in the German aerospace sector. The module German for Engineers is designed to help students to work in the engineering environment. After completing the A2.1 module, students can understand sentences and frequently used expressions related to areas of most immediate relevance, communicate in simple and routine tasks requiring a simple and direct exchange of information on familiar and routine matters.

Content

- Introductions
- Talking about professions, education, CV
- Talking about daily routine
- Hobbies and leisure time
- Making appointments on the phone
- Reading short messages and notes
- Reading messages and announcements at work
- Talking about frequency
- Talking about cause and effect (wenn-dann)
- Past time (Perfekt and Präteritum)
- Konjunktiv II
- Negation
- Verbs with prepositions

After completing the A2.1 module, students can understand sentences and frequently used expressions related to areas of most immediate relevance; communicate in simple and routine tasks requiring a simple and direct exchange of information on familiar and routine matters; describe in simple terms aspects of your background, immediate environment and matters in areas of immediate need.

Content
- Talking about travelling, countries, means of transport
- Talking about directions
- Giving recommendations (sollten)
- Describing people
- Describing items and comparing items
- Talking about plans and itineraries
- Using the comparative and superlative
- Talking about preferences
- Adjective declension
- Relative clause
- Accusative Prepositions

German for Engineers B1.1

Module title:
German for Engineers B1.1
No information

Website:
http://www.mse.tu-berlin.de

Learning Outcomes
During and after their studies, MSE students are most likely to collect work experience in the German aerospace sector. The module German for Engineers is designed to help students to work in the engineering environment by improving their basic German language skills with a focus on specialized vocabulary in engineering.

Content
- Reading and discussing professional articles
- Professional activities
- Phone conversations
- Describing graphics
- Verbs with prepositions
- Temporal prepositions
- Infinitive with zu
- Passive
- n-Deklination

**Miscellaneous**

Prerequisite for a successful completion is the regular participation in the course (at least 80%).
Learning Outcomes

The module imparts knowledge on the essential basics of problems in planning and operating manned space missions. In this connection, the technical aspects as conception and operation of space habitats and the medical and psychological processes of adaption to the space environment are discussed. This interdisciplinary approach shall enable students to understand the complexity of manned space missions in terms of technical, medical and psychological aspects and give them the skills to support the design of human spacecraft.

Content

Technical Aspects of Human Spaceflight:
- History of manned spaceflight
- Capabilities and boundaries of human in space
- Selection and training of astronauts
- Orbital equipment
- Space stations and manned spacecraft
- Habitats for Moon and Mars
- Exploration strategies and mission architectures

Space Psychology:
- Microgravity and changed day-night-cycle as specific stress factors of the space environment
- Physiological problems of adaption to zero-gravity (hear circular flow system, vestibular system, muscle and bone system, space sickness)
- Effect of microgravity on cognitive and psychomotor functions and performance
- Psychological effects of isolation and confinement on performance
- Mental state and socio-psychological processes within astronaut crews
- Psychological aspects of selection, training and support of astronauts

Learning Outcomes

Nowadays, technical knowledge is not the only competence necessary for a successful career. Many space start-ups are founded and large companies and agencies adapt to challenges using new methods of innovation management that are imparted and applied in this module.

Content

- Innovation processes and methods
- Innovation strategies
- Business models
- Entrepreneurship
- Space related aspects of entrepreneurship and funding
- Agile management

Activity, engagement, experimentation and learning progress throughout the course is assessed. The course is concluded with a final test about the whole content of the lecture course.
Duration of the Module

This module can be completed in one semester.

Maximum Number of Participants

The maximum capacity of students is 20.

Registration Procedures

Registration at the MSE secretary according to the MSE study and examination regulations. Dates and deadlines will be announced by semester start.

Space Engineering (Master of Science)
StuPO 2014
Modulisten der Semester: SS 2020

Miscellaneous

No information
Introduction to Satellite Geodesy

Learning Outcomes

The module includes the fundamental principles of Satellite and Space Geodesy, such as geodetic, astrometric and astronomic reference frames and transformations, Earth Orientation, Satellite Orbit determination and introduces the most important space geodetic techniques: GNSS, VLBI, SLR, DORIS, Satellite Altimetry, InSAR and Gravity Field Satellite Missions. The main geophysical processes that cause changes of the antenna reference points are discussed as well, within a section on data analysis of space geodetic techniques. The students of space engineering will gain an initial overview of how Earth observing and navigation satellites as well as ground-based observatories can be used for current geoscientific and astrometric applications involving the analytical concepts of geodesy. The module consists of two parts, a lecture and the associated computer-based exercise, where the most important topics are further illustrated through practical examples.

Content

Conceptual basics of coordinate systems
Time scales
Terrestrial reference frames
Celestial reference frames
Earth orientation
Orbit determination
Space geodetic techniques: GNSS, VLBI, SLR, DORIS, satellite altimetry, spherical harmonics and gravity field, satellite-based gravity field determination, methods of space geodetic data analysis

Planetary Exploration and Space Robotics 1

Module title:
Planetary Exploration and Space Robotics 1

Credits: 6
 Responsible person: Kryza, Lennart

Office: F 6
 Contact person: Kryza, Lennart

Display language: Englisch
 E-mail address: lennart.kryza@tu-berlin.de

Learning Outcomes
This module covers the fundamentals of planetary exploration and space robotics. Basics of planetary physics, exploration of celestial bodies by robots and in-situ resource utilization will be taught. The design, testing and operation of robotic systems in space and on planetary surfaces will be imparted and parallels to analogue system and terrestrial testbeds are taught. The knowledge will be applied in a hands-on project by working on such a terrestrial analogue system.

Content
- Basics of planetary physics
- Subsystems of planetary rover and systems design strategy
- Introduction to planetary missions
- Robot Operating System
- Student robotic system design project
- Operation of a planetary robot

Learning Outcomes
The course focuses on developing practical skills required for successful management of space projects.

Content
- Fundamentals of project management
- Factors of project success
- Project initiation phase and environmental scanning
- Work breakdown structure / analytic hierarchy process (AHP)
- Resources and time planning
- Risk management
- Project implementation
- Project Management Standards: PMI
- Leading a project Team by using Team Management System
- Basics of Agile Project Management (Scrum)
- Scrum versus Waterfall Project Management
- Controlling
- Team management systems
- Leadership in project calculation for project managers
- ECSS Standards

Learning Outcomes

The workshop allows students to get deep insights into the effects of space radiation and the methods of mitigating space radiation effects.

Content

- Radiation concept and units
- Preparation of a total ionizing dose (TID) irradiation test setup with electronic components
- Space radiation environment and its effects on electronics
- Detailed TID effects in electronics
- Single Event Effects (SEE) in electronics
- Introduction to computational tools and calculation of radiation models
- Simulation of radiation effects on electronics
- Hands-on radiation test campaign in a radiation chamber

Miscellaneous
No information
Learning Outcomes
Participants who complete this course will gain solid knowledge in radio communication and signal processing. They will understand the working principles of hardware and software related to satellite communication. In combination with the knowledge and skills gained in previous courses in space engineering, the participants will be able to set up a satellite communication link. In scope of a curricular project, the participants will build a ground station in interdisciplinary teams. They will scientifically document and present their work at the end of the project.

Content
- Applied technical know-how regarding the transmission of radio signals: characteristics of electromagnetic waves, components for transmitter and receiver circuits, antennas, transmission path, modulation and encoding schemes, operating modes, EMC etc.
- Practical hardware and/or software design as well as manufacturing resp. implementation
- Using electrical and HF measuring instruments
- Methodologically planning an organizing a project
- Scientific documentation and presentation of the practical work

The Workload of the module sums up to 180.0 Hours. Therefore the module contains 6 Credits.

Description of Teaching and Learning Methods
One or multiple projects in the field of satellite communication, partly chosen by the students itself, will be realized in structured teams. Each group or sub-team develops its part of the overall project and will be supported by experienced advisors. The knowledge needed to elaborate a specific subtask will be taught in small workshops. The groups document their work in form of a paper and present their results together in a final presentation.

Requirements for participation and examination

Miscellaneous
Within the conceptual framework of the meta-project "Space Interdisciplinary studies in the fields of Robotics and Radio communications" (SIERRA) the focus is currently on the interdisciplinary cooperation of the Chair of Space Technology and the Chair of High Frequency Technology, supported by the Amateur Radio Club of TU Berlin (AfuTUB / DK0TU).
Learning Outcomes

After this module the students are familiar with the most important observation methods in space geodesy and how the data is analysed. They know the strengths and weaknesses of the individual techniques, how they contribute to measure the three pillars of geodesy (Earth shape, Earth rotation and Earth gravity field) and what type of phenomena and processes in the Earth system they can observe and monitor. They understand that only the integrated analysis of a variety of complementary sensors allows the separation of different processes of global change in the Earth system.

Content

Measurement principles of the most important space- and ground-based geodetic observation techniques:
- Very Long Baseline Interferometry (VLBI)
- Satellite and Lunar Laser Ranging (SLR/LLR)
- Global Navigation Satellite Systems (GNSS, including GPS, GLONASS, GALILEO)
- Doppler Orbitography and Radio positioning Integrated by Satellite (DORIS)
- Ocean and ice altimetry
- InSAR and gravity field satellite missions and innovative future concepts.

The application of these techniques to determine the three pillars of space geodesy:
- The Earth's geometry and deformation
- The Earth orientation and rotation
- The Earth gravity field and its temporal variations

Further topics:
- Methods to solve huge parameter estimation problems and for time series analyses are explained and applied
- Estimation/monitoring of station motion and surface deformation
- Models of the processes deforming the Earth's surface like plate tectonics, post-glacial rebound, solid Earth tides, surface loads
- Importance of deformation measurements for natural hazards and early warning systems
- Methods to determine the global gravity field of the Earth and its temporal variability including satellite to satellite tracking, satellite gravity gradiometry (SGG) and altimetry
- Orbit determination methods
- Static gravity field as reference surface and information about the structures and processes in the Earth's interior
- Geodetic and geophysical models of the Earth orientation and rotation including effects of Sun, Moon and planets, and of the different components of the Earth system
- Comparisons with observed Earth orientation parameters series
- GNSS remote sensing comprising atmospheric sounding from ground and space, determination of water vapor in the troposphere and the electron density in the ionosphere
- GNSS reflectometry and scatterometry
- Importance for meteorology, weather forecasts and climatology

Learning Outcomes

The module imparts the basics of satellite technology. In this context, all segments of a satellite mission are discussed. Especially, all subsystems of a satellite and their interdependencies are presented by experts. The technologies and design processes are treated in detail. Students shall develop a well-founded base of knowledge about every aspect of a complex satellite system. The skills imparted in this module are valuable for making valuations on satellite subsystems. This shall support the systems engineering competence of the students.

Content

- Classification of satellites
- Electrical Power Subsystem (EPS)
- Thermal Control Subsystem (TCS)
- Structure and Mechanisms (S&M)
- Attitude Control Subsystem (ACS)
- On-Board Computer (OBC)
- Telemetry, Tracking & Command (TT&C)
- Satellite propulsion

| | | | 180.0h |

The Workload of the module sums up to 180.0 Hours. Therefore the module contains 6 Credits.

Description of Teaching and Learning Methods

The course covers all subsystems of satellites in technical detail. Several subsystem experts give lectures on specific aspects of satellite technologies and further elaborate on their field of work with examples from real satellite missions. Comprehensive homework exercises about every subsystem help the student to deepen the knowledge and apply engineering skills and tools for defining satellite subsystems.

Learning Outcomes
Skills in communication and social competence are key factors for prospective engineers seeking leading positions. The module will prepare students for the social challenges in the work environment and provide a basic understanding and a hands-on experimentation space for the key soft skills required to lead employees, teams and organisations. In immersive real-life situations, students will train and develop their abilities in teamwork, adaptability, collaborative problem solving and other key transferrable soft skills.

Content
- Communication skills
- Teamwork and collaboration
- Active listening
- Critical observation
- Feedback and feedforward
- Story telling
- Collaborative problem solving and decision making

Learning Outcomes
Nowadays, a well-founded practical knowledge in electronics is inevitable for space systems engineers. Electronics and hardware-near software are significant parts of any space mission. The systems engineer shall understand the main requirements on spacecraft equipment and their interconnections with respect to electrical characteristics and interfaces. The module imparts the practical skills relevant to designing hardware and software for a spacecraft. With completion of the course, students shall be able to conceptualize an electronics system, define interfaces, design and manufacture printed circuit boards and write hardware-near software in context of spacecraft systems.

Content
- Basics of electronics
- Analog electronics
- Design of electronics circuits
- Handling of laboratory equipment
- Digital electronics
- Programming of microcontrollers
- Hardware and software of satellite systems

The Workload of the module sums up to 180.0 Hours. Therefore the module contains 6 Credits.

Description of Teaching and Learning Methods
The course is highly practice-oriented. All students receive a comprehensive package of electronics parts and measurement equipment in the beginning of each semester. Theoretical contents converts directly into practical experience during the lectures in which the electronics parts are used. There are multiple hands-on homework exercises throughout the semester in which students build circuits and write software. In addition, specific space-related aspects of electronics are covered in guest lectures. During both semesters, a joint project with the lecture course Spacecraft Dynamics and Control is conducted. Small teams of students build a FloatSat with different sensors and actuators. The FloatSat is put on an air-bearing table and shall perform attitude control maneuvers. The electrical design, manufacturing and demonstration of core functionalities are assessed in scope of the Space Electronics lecture course.

Requirements for participation and examination
Desirable prerequisites for participation in the courses:
None.

Learning Outcomes
Goal of the module is to develop a groundinglaying knowledge in the basics of space flight mechanics. The course covers all types of orbits and their disturbances, covering the laws of celestial mechanics, time and reference systems. For the students it is important to develop skills in solving mathematical navigational problems under usage of solving algorithms. The competencies gained are systematically analysing problems, developing qualitative solutions and programming software.

Content
- Two-body problem
- Undisturbed satellite orbits
- Time and reference systems
- Gravitative and non-gravitative forces
- Perturbation theory
- Orbit integration
- Special orbits
- Relative motion
- Interplanetary orbits and ascension
- Special problems of orbital mechanics
- Impulsive orbit transitions
- Re-entry of spacecraft
- Applications

**Learning Outcomes**

Goal of the module is to impart knowledge on several programmatic aspects of space missions. This includes a good knowledge of the international activities in astronautics. One focus of the module is set on gaining competencies in planning a space mission through its whole life cycle. Another focus is set on mission operations, which covers setting up ground stations and mission control structures, as well as handling procedures for mission operations.

**Content**

Basics of space mission planning; space activities of ESA, NASA, Germany, France; basics of space operations; satellite operations; ground station concepts; space operations centres (GSOC, ESOC); tools for space mission planning; regulatory aspects for space missions (space law, space debris, frequency coordination); project on mission design.

Website: http://www.mse.tu-berlin.de

Learning Outcomes
The module covers the basics of remote sensing with spacecraft. After some system-theoretical and electronic fundamentals space sensors for gamma rays, X-rays, Ultra-Violet and visible light, for infrared and far infrared radiation and for microwaves are discussed. Calibration and ground data processing are elaborated finally.

Content
- Introduction to Earth observation
- Electromagnetic waves
- Earth observation system theory
- Sensor electronics
- Gamma-ray sensors
- UV and optical space sensor systems
- Infrared sensor systems
- Microwave sensor systems
- Sensor data processing
- Sensor calibration.

Display language: Englisch
E-mail address: martin.buscher@tu-berlin.de

Learning Outcomes
The module imparts the basics of methodical approaches of spacecraft design for all segments of a space mission. A focus is set on design steps for spacecraft subsystems. The students shall be able to design any subsystem of a spacecraft to a certain degree. Methods of system verification, fault tolerant design and cost estimation shall be part of the basic knowledge of a prospective space systems engineer. Another focus in this course is to gain experience in working within an interdisciplinary group. Discussion and definition of interfaces, making compromises in trade-offs and focusing on a common goal in a team are daily routine in spacecraft engineering.

Content
- Spacecraft system planning
- Space environment and considerations on designing a spacecraft
- System integration
- System verification
- Space mission cost estimation
- Space law
- Phases and life cycle of a space project
- Design reviews
- Space project documentation

**Learning Outcomes**

The module imparts the basics of the methodical design of spacecraft from the hands-on perspective. A focus is set on gaining practical design skills, especially in the area of electromechanics and informatics. The students shall be able to design a near-spacecraft type subsystem on a comparatively small scale. In a practical project, e.g. the development and launch of a CanSat or Free-Falling Unit (FFU) for sounding rocket experiments, students shall gain experience in working within an interdisciplinary group. The students are learning to structure, plan and perform individual technical tasks in a multidisciplinary team to realize a space mission or experiment within a short timeframe. Discussion and definition of interfaces, making compromises in trade-offs and focusing on a common goal in a team are daily routine in spacecraft engineering.

**Content**

- Electronics design
- Definition of requirements
- Electromechanical interface definition
- Project planning and design according to standards
- Cost estimation
- Phases of a space mission
- Project reviews

Spacecraft Dynamics and Control

Module title:
Spacecraft Dynamics and Control

Credits: 9
Responsible person: Yoon, Zizung

Office: F 6
Contact person: Yoon, Zizung

Display language: Englisch
E-mail address: zizung.yoon@tu-berlin.de

Learning Outcomes
The module provides the theory and practical application for spacecraft dynamics and control. The students should learn all relevant elements to design and analyze an attitude control system. Thus the goal of the module for the students is to gain theoretical knowledge for spacecrafts attitude control, model dynamic systems and implement the control theory in a real control system.

Content
- Mission analysis and requirements on attitude control systems
- Various possibilities of parameterization of spacecraft attitudes
- Kinematics of attitude control; Rigid body dynamics
- Attitude determination (deterministically, statistically)
- Classical control theory (Root locus, PID-controller)
- Model-based state prediction
- Basics and methods of state control

The Workload of the module sums up to 270.0 Hours. Therefore the module contains 9 Credits.

Description of Teaching and Learning Methods
The module consists of lectures, programming exercises, homework and group project work.

Requirements for participation and examination
Desirable prerequisites for participation in the courses:
- Basic knowledge about satellite technologies
- Basic knowledge about space flight mechanics

Mandatory requirements for the module test application:
No information

Module completion
Grading: graded
Type of exam: Portfolio examination
Language: English
100 points in total
**Grading scale:**

Note: 1.0 1.3 1.7 2.0 2.3 2.7 3.0 3.3 3.7 4.0

Punkte: 95.0 90.0 85.0 80.0 75.0 70.0 65.0 60.0 55.0 50.0

**Duration of the Module**

This module can be completed in 2 semesters.

**Maximum Number of Participants**

This module is not limited to a number of students.

**Registration Procedures**

Registration at the MSE secretary according to the MSE study and examination regulations.

Dates and deadlines will be announced by semester start.

**Recommended reading, Lecture notes**

<table>

</table>

**Additional information:**
The script will be handed out for free in the first lecture.

**Recommended literature:**

James Wertz, Spacecraft Attitude Determination and Control, Dortrecht 1991
Marcel Sidi, Spacecraft Dynamics and Control, Cambrindge Press, 2000
Peter Berlin, Satellite Platform Design, Kiruna 2005
Peter Hughes, Spacecraft Attitude Dynamics, Dover Publication Inc, 2004

**Assigned Degree Programs**

This module is used in the following modulelists:

**Space Engineering (Master of Science)**

StuPO 2014
Modullisten der Semester: SS 2020

**Miscellaneous**

*No information*
Learning Outcomes

The module gives a technical overview on rocket and spacecraft propulsion systems. Students will understand the basic principles and system solutions for a large variety of propulsion technologies.

Content

- Basics of orbital mechanics
- Theoretical basics of rocket propulsion systems
- Chemical propulsion systems
- Propellants for space applications
- Propellant tanks and fuel supply
- Combustion chambers
- Thrust vector control
- Initial aid systems
- Test facilities
- Electrical propulsion systems
- Nuclear propulsion systems
- New types of propulsion systems

Module Components

</tbody>
</table>

The Workload of the module sums up to 180.0 Hours. Therefore the module contains 6 Credits.

Description of Teaching and Learning Methods

The module consists of theoretical lectures and seminars. Some seminars are elaborated by students themselves and supervised by the lecturers. Instead of seminars and exercises a project can be conducted.

Requirements for participation and examination

Desirable prerequisites for participation in the courses:

- Basic knowledge about space technologies
- Basic knowledge about satellite technologies
- Basic knowledge about space flight mechanics

Mandatory requirements for the module test application:
